Quality

Because Quality Is Your Capital

Where is **synko** Quality used?

synko Quality is used by companies which are lawfully obliged to completely and continuously document the quality of their goods (e.g. pharmaceuticals, chemicals) or if they have committed themselves, as part of a highly integrated

supply chain vis-à-vis their customers, to comprehensive quality control (e.g. industrial distribution, automotive-suppliers). Thus, **synko Quality** sustainably supports your company in offering consistent high quality to your customers.

What are the advantage of **synko** Quality?

synko Quality increases your logistic safty

In combination with synko BarScan your warehouse employees constantly have control over whether or not the current inventory movement in the predetermined context is allowed. Thus, synko Quality ensures that only products that meet your quality requirements leave your business.

synko Quality increases the efficiency of your workflow

A high level of integration of quality assurance reduces communication activities between individual departments. The release or blocking of certain data can immediately be seen by warehouse employees on their mobile devices and they can respond accordingly.

synko Quality establishes confidence

Analyses are sustainably stored in your IT system. Thus, the delivery of goods, their quality, and the customer or in which production order they were used can be traced even after many years. This transparency does not only provide assurance but builds your customers confidence in your company.

We would be more than happy to show the benefits for your company in a personal presentation.
